INTERNET TIPS | 01

Build a Better Wi-Fi Password

A stronger Wi-Fi password doesn't have to be harder to remember.

1. **Make it long.**
   Aim for at least 20 characters. Longer passwords are generally harder to crack.

2. **Try a passphrase.**
   Combine several randomly chosen, unrelated words to create something memorable.

3. **Make it unique.**
   Never reuse a password or include names, birthdays, or addresses.

4. **Protect your network.**
   Use WPA3 when supported (or WPA2-AES where needed). Also, secure your router's administrator login with a separate password.

EXAMPLE ONLY — DO NOT USE THIS PASSWORD
